

# Sentiment Analysis Prompt Optimization

Before prompting, always have a clear idea/template of what you're trying to achieve. This will guide your prompt and help you to include all necessary details in your prompt.

Below are a few points that can affect the quality of your sentiment analysis

1. Not defining the sentiment categories you want: Positive / Negative / Neutral / Mixed
2. Not specifying whether every comment should be analyzed individually.
3. Not telling the AI model how to treat sarcasm, slang, or Nigerian broken English
4. Not specifying the output structure
5. Not explaining what the color coding should look like
6. Not asking for one or two actionable, specific recommendation based on the findings

Here is how I would prompt an LLM for best and optimal result

I will start with a background context, followed by the task(bullet point or numbered) and lastly by the output format
